

Database Design

5-2

Relationship Types

Objectives

This lesson covers the following objectives:

- Recognize and give examples of a one-to-one relationship
- Recognize and give examples of a one-to-many relationship
- Recognize and give examples of a many-to-many relationship
- Recognize redundant relationships and remove them from the ERD

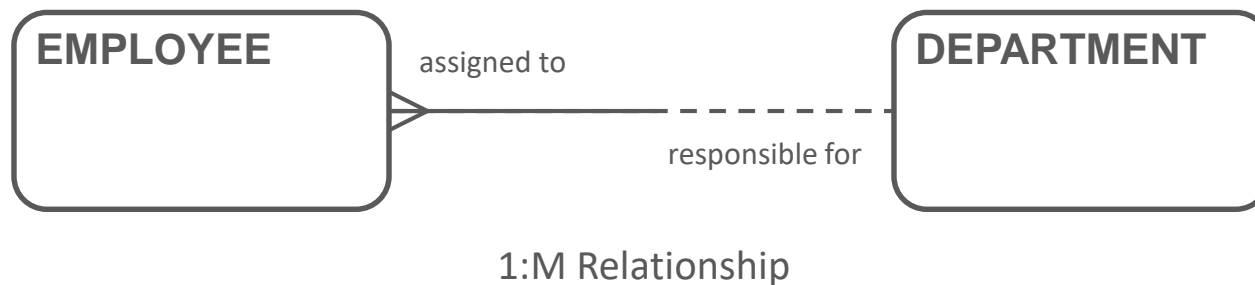

Purpose

- Can one PERSON own many DVDs, or only one ?
- Can one DVD be owned by many PERSONs?
- As we refine and improve our model, we want to make sure our entity relationships correctly model our business rules.
- Remember, you can avoid future costly mistakes by thinking through the details early on.

One-to-Many (1:M) Relationships

- The various types of 1:M relationships are most common in an ER Model.
- You have seen several examples already.

Relationship Types
1:M

Many-to-Many (M:M) Relationships

- The various types of M:M relationships are common, particularly in a first version of an ER model.
- In later stages of the modeling process, all M:M relationships will be resolved, and disappear.

Relationship Types
M:M

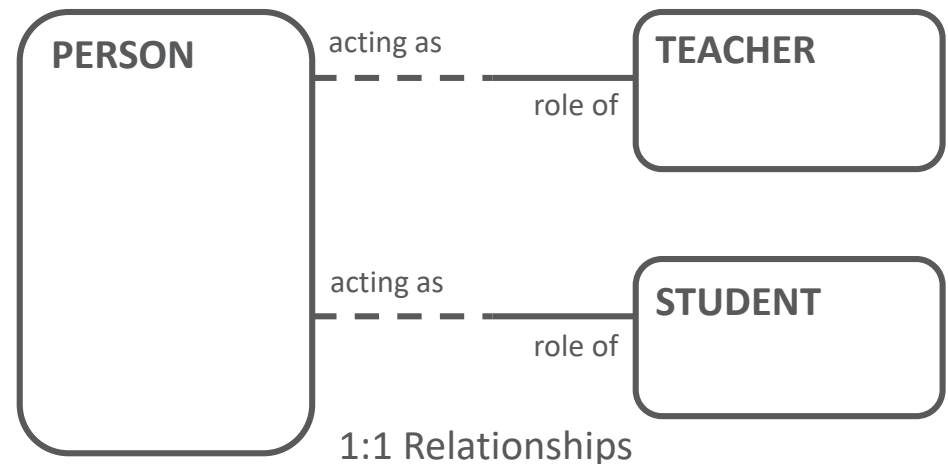

M:M Relationships

One-to-One Relationships For Roles

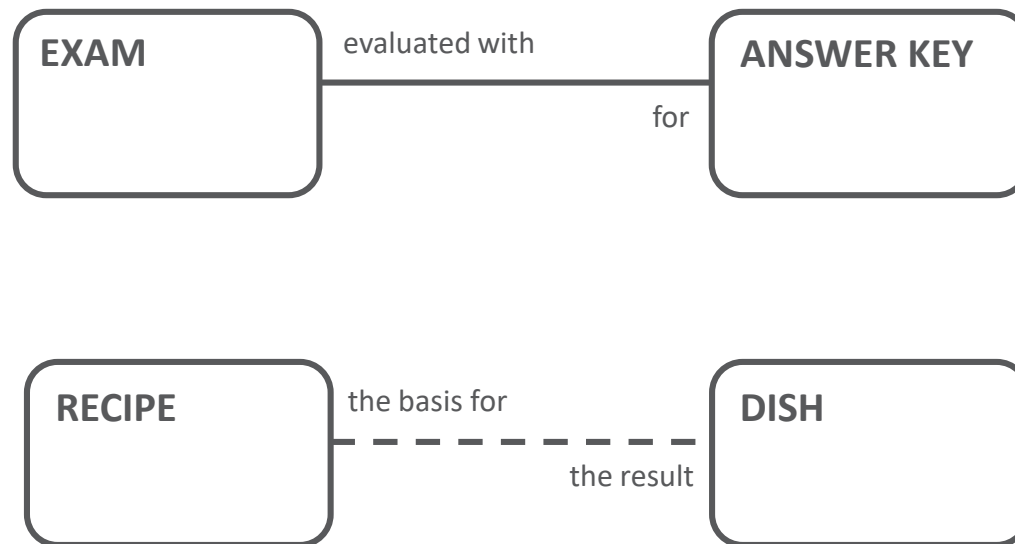

- Usually you will find just a few of the various types of 1:1 relationships in every ER model.
- Mandatory at one end of the 1:1 relationship commonly occurs when roles are modeled.

Relationship Types
1:1

One-to-One Relationships For Processes

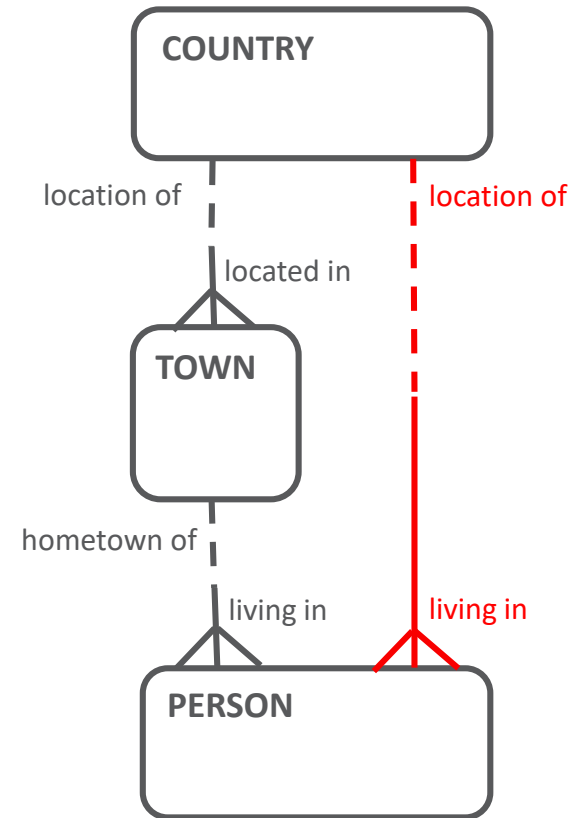

- 1:1 relationships (of all three variations) also occur when some of the entities represent various stages in a process.

1:1 Process Relationships

Redundant Relationships

- A redundant relationship can be derived from another relationship in the model.
- In this example, you can derive the relationship from PERSON to COUNTRY from the other two relationships (COUNTRY to TOWN, TOWN to PERSON), so you should **remove** the direct relationship from COUNTRY to PERSON.

Redundant Relationships

- However, be careful of concluding that a relationship is redundant based on the structure alone.
- Read the relationships to check.
- The ERD shown here **does not** reflect a redundant relationship.

Terminology

Key terms used in this lesson included:

- Many-to-many (M:M)
- One-to-many (1:M)
- One-to-one (1:1)
- Redundant

Summary

In this lesson, you should have learned how to:

- Recognize and give examples of a one-to-one relationship
- Recognize and give examples of a one-to-many relationship
- Recognize and give examples of a many-to-many relationship
- Recognize redundant relationships and remove them from the ERD
